CHRIST (Deemed to be University), Bangalore
Department of Computer Science

Course Code: MCA523C-5 **Course: UI/UX Design**

Domain Selection & Problem Definition Guidelines

Objective: Identify a meaningful real-world problem within a selected domain and define the problem statement, user needs and business goals as the foundation for subsequent UI/UX design exercises.

Task: Each student should propose THREE suitable domains from which ONE domain will be selected/approved by the faculty evaluator.

1. Domain selection:

Choose three domains that you are interested in exploring.
For example:

- Education & Learning
- Healthcare & Wellness
- Banking & Finance
- Agriculture & Food Technology
- Sustainability & Environment
- Smart Campus
- Business & Retail
- Transportation & Mobility
- Tourism & Hospitality
- Human Resources & Employment
- Accessibility & Assistive Technology
- Social/Community Development
- Government & Public Services
- Personal Productivity
- Fitness & Wellness
- Any other relevant domain

Note: The same domain can be selected by multiple students, but the **problem identified within the domain should be different**.

2. Identify a Real Problem

After the domain is selected, identify a specific user problem within that domain.
Write: What problem are you trying to solve?
Example:

- Domain: Education
- Target Users: University Students
- Problem: Students find it difficult to identify relevant learning resources based on their specific learning needs.

The problem should focus on a user need or pain point, rather than immediately proposing an application.

3. Identify Target Users

Clearly identify who experiences the problem.
For example:

- Students/ Teachers
- Patients
- Senior citizens
- Commuters
- Customers
- Employees
- Small business owners
- Community members

Write: Target Users: _____

4. Define User need:

Identify what the users actually need to accomplish or experience.
Write: User Need: _____
Example:
Students need a simple way to identify and access learning resources relevant to their specific learning gaps.

5. Identify Business/Organizational Goals

Identify 2–3 goals that the proposed solution should support.
For example:

- Improve service efficiency
- Reduce user effort
- Increase engagement
- Reduce errors
- Improve accessibility
- Improve service adoption
- Increase user satisfaction

Write: Business/Organizational Goals: 1. 2. 3.

6. Problem Statement

Develop a concise problem statement combining the user, problem, and context.
Write: Problem Statement:

Note: A good problem statement should clearly communicate: User → Problem → Need → Context

7. User Stories

Create at least 5 user stories based on the identified user needs.
Use the format: As a [user], I want to [action/need], so that [benefit].
Example:

> As a student, I want to identify learning resources based on my learning gaps, so that I can improve my understanding of difficult topics.

Submission (PDF File):

Each student should submit:

1. Three Domain Choices
2. Faculty-Selected Domain
3. Problem Statement
4. Target Users
5. User Needs
6. Business/Organizational Goals
7. Minimum 5 User Stories

Important
Do not start with the solution. Start with the problem.
Domain → User → Problem → Need → Business Goal → User Stories
This problem will form the foundation for the subsequent UI/UX exercises and the final design project
